

Elbow Pathway (V9) – 16.07.2019

SELF-CARE AND SELF-MANAGEMENT

Integrated MSK Service Website: <https://sussexmskpartnershipcentral.co.uk/>

OUTCOME MEASURES

- MSK-HQ
- Oxford Elbow Score

	Elbow pain
Referral reason / Patient presentation	Elbow pain – Non-traumatic Lateral / Medial tendinopathy
Primary Care Management (including Assessment and Diagnostics)	<p>Assessment: history - mechanism of onset, focal location of pain, examination. No diagnostic at this stage. Pain relief in line with agreed formularies /guidance. . Patient education, activity modification and relative rest, use of tennis elbow strap. Injection not recommended.</p> <p>http://sussexmskpartnershipcentral.co.uk/wp-content/uploads/2016/11/161125-Lateral-elbow-tendinopathy-V5.pdf http://sussexmskpartnershipcentral.co.uk/wp-content/uploads/2016/11/161125-Medial-elbow-tendinopathy-V5.pdf</p> <p>Management: Pain relief in line with agreed formularies /guidance. . Patient education, activity modification and relative rest, use of tennis elbow strap. Injection not recommended.</p>
Thresholds for Primary Care to initiate a referral	Refer to physio with 6 weeks of symptoms consistent with a diagnosis of lateral/medial elbow tendinopathy.
Management Pathway for the Integrated MSK Service <i>Outcome tools: MSK HQ, Oxford Shoulder score</i>	Persistent symptoms despite 3 months of rehabilitation consider ONLY 1 injection with severe symptoms ensuring patient education on risk vs benefit and evidence base on outcomes.
Management within co-located clinic (seen by an AP with a consultant present) or secondary care	Consider referral to secondary care if symptoms persist despite conservative management
Thresholds for referral to Specialist In-patient care (Choice)	<p>PRP injections may be considered as part of a trial. Tendon release -• Persistent pain</p> <ul style="list-style-type: none"> • Condition limiting function • Symptoms persist • Patient wants and is fit for surgery <p>Risk / benefit information for ECRB release</p> <p> ECRB Release.docx</p>
Management pathway for Specialist In-patient care	<p>Secondary care surgical guidelines ECRB release</p> <p> SE Pathway Guidelines Secondary</p>

Referral reason / Patient presentation	Elbow pain – Non-traumatic Olecranon bursitis
Primary Care Management (including Assessment and Diagnostics)	<p>Assessment: history - mechanism of onset (to exclude traumatic triceps injuries), focal location of pain/swelling, Elbow examination. No diagnostic at this stage.</p> <p>Management: Management (including condition-specific self-care options): If evidence of infection – antibiotics and rest If large and non-infected bursitis – aspirate If aspiration is not effective then consider steroid injection</p>
Thresholds for Primary Care to initiate a referral	Non resolving or unconfirmed diagnosis refer to secondary care. Consider 2WW referral according to guidelines.
Management Pathway for the Integrated MSK Service <i>Outcome tools: MSK HQ, Oxford Shoulder score</i>	N/A
Management within co-located clinic (seen by an AP with a consultant present) or secondary care	
Thresholds for referral to Specialist In-patient care (Choice)	N/A
Management pathway for Specialist In-patient care	

Referral reason / Patient presentation	Elbow pain – Non-traumatic Ulnar Neuropathy
Primary Care Management (including Assessment and Diagnostics)	<p>Assessment: history - mechanism of onset, location of symptoms. Neural symptoms in ulnar distribution. Elbow examination - often positive tinels sign over cubital tunnel. No diagnostic at this stage.</p> <p>Management (including condition-specific self-care options): Patient education Avoid sustained elbow flexion especially at night. Avoid local elbow pressure. Refer to physio for mild sensory symptoms that persist despite following leaflet advice. Hyperlink leaflet http://sussexmskpartnershipcentral.co.uk/wp-content/uploads/2016/09/Elbow_Ulnar_Neuropathy.pdf</p>
Thresholds for Primary Care to initiate a referral	Progression of intrusive symptoms - refer iCATS Fixed sensory loss – loss of two point discrimination at 3mm Hypothenar muscle wasting and weakness. Clawing of ring and little finger
Management Pathway for the Integrated MSK Service <i>Outcome tools: MSK HQ, Oxford Shoulder score</i>	Consider investigations with NCS. Consider XR to exclude Elbow bony pathology. Consider excluding C8 nerve root, MRI for clinical correlation.

Management within co-located clinic (seen by an AP with a consultant present) or secondary care	Urgent referral to secondary care for presentation of severe nerve compromise e.g. clawing of the little and ring finger.
Thresholds for referral to Specialist In-patient care (Choice)	Risk / benefit information Cubital Tunnel Decompression  Cubital Tunnel Decompression.docx
Management pathway for Specialist In-patient care	Secondary care surgical guidelines Cubital Tunnel Decompression  SE Pathway Guidelines Secondary

Elbow pain Distal biceps rupture	
Primary Care Management (including Assessment and Diagnostics)	Assessment: history - traumatic mechanism of onset, location of pain to anterior elbow. Possible distal bunching of biceps. Management: Urgent referral to iCATS
Thresholds for Primary Care to initiate a referral	
Management Pathway for the Integrated MSK Service <i>Outcome tools: MSK HQ, Oxford Shoulder score</i>	Urgent MRI scan.
Management within co-located clinic (seen by an AP with a consultant present) or secondary care	Urgent referral to secondary care with confirmed diagnosis.
Thresholds for referral to Specialist In-patient care (Choice)	N/A
Management pathway for Specialist In-patient care	Secondary care surgical guidelines distal biceps rupture  SE Pathway Guidelines Secondary

Elbow Osteoarthritis	
Referral reason / Patient presentation	
Primary Care Management (including Assessment and Diagnostics)	Assessment: history, location of pain, Elbow examination. Management: Pain relief in line with agreed formularies /guidance. Patient education and activity modification.
Thresholds for Primary Care to initiate a referral	Persistent symptoms for 6 weeks or more.

Management Pathway for the Integrated MSK Service <i>Outcome tools: MSK HQ, Oxford Shoulder score</i>	Diagnostics at the point of triage (x-ray). Patient education and discussion around self-management. Consider a physio referral. Discuss secondary care opinion for intrusive symptoms with significant impact on function. Consider referral for surgery.
Management within co-located clinic (seen by an AP with a consultant present) or secondary care	Based on the level of symptoms and x-ray results, refer for surgical opinion through SDM process.
Thresholds for referral to Specialist In-patient care (Choice)	Debridement versus total elbow replacement. Risk / benefit information elbow replacement  Elbow Replacement.docx
Management pathway for Specialist In-patient care	Secondary care surgical guidelines elbow replacement  SE Pathway Guidelines Secondary

Referral reason / Patient presentation	Elbow joint pain – query differential diagnosis
Primary Care Management (including Assessment and Diagnostics)	Assessment: history - mechanism of onset, location of pain, examination. No diagnostic at this stage. Management: Pain relief in line with agreed formularies /guidance. Patient education and activity modification.
Thresholds for Primary Care to initiate a referral	Persistent symptoms for 6 weeks or more.
Management Pathway for the Integrated MSK Service <i>Outcome tools: MSK HQ, Oxford Shoulder score</i>	Consider investigation (MRI or x-ray) to correlate considered differentials - plica, OCD, loose bodies etc.
Management within co-located clinic (seen by an AP with a consultant present) or secondary care	
Thresholds for referral to Specialist In-patient care (Choice)	Structural findings on imaging requiring surgical intervention with SDM with patient
Management pathway for Specialist In-patient care
